

**She didn't just
survive her story.
She rewrote it.**

At just 26, she walked
in carrying more than
a diagnosis, she carried
the weight of family
history.

A family history she couldn't ignore

- Lost her mother to ovarian cancer. She was BRCA-positive.
- She and her sister inherited the same BRCA-positive gene.
- Her sister opted for preventive surgery.
- She was advised the same, but academics took priority.
- Until one day, she found a lump.

A diagnosis that changed everything

- Triple-negative breast cancer.
- 35 mm tumour with lymph node spread.
- Grade 3. BRCA-positive.
- Severe side effects due to chemotherapy. She could barely walk.

But side effects were temporary. Her will wasn't.

A surgical plan built around her future

- Left mastectomy with axillary clearance.
- Risk reduction surgery in the right breast.
- Breast reconstruction with expander, implant and flap coverage.

**A COLLABORATIVE APPROACH:
ONCOLOGY + PLASTIC SURGERY**

Her healing went deeper than the scar

- Faced genetic fear with unmatched grace.
- Regulated grief with resilience.
- Met pain with purpose and planning.

Her scars don't define her - her spirit does.

And then, she rewrote her story

Today, she's a survivor.
A newly married woman.
A life reclaimed.

At Medanta, we don't
just treat disease, we
honour journeys like
hers, where bravery
is inherited and hope
is chosen.

Handled with precision, empathy, and expertise

This unique journey was spearheaded by **Dr. Kanchan Kaur, Senior Director, Cancer Care, Medanta Gurugram**, alongside a multi-disciplinary team of medical oncologists, breast surgeons, plastic surgeons, and fertility specialists.
